Steadicam is a film/video camera stabilizing system that has now become a standard item in the filmmaker's list of production tools.

Since it was first introduced in the mid 70's, Steadicam has changed film and video production techniques all over the world. It allows the camera to move more freely - arcing, doubling back, booming, panning, and tilting simultaneously in a way that would drive a dolly grip insane. Hollywood cameraman Garrett Brown and Ed DiGiulio of Cinema Products Corporation shared an Oscar in 1978 for the invention and development of the Steadicam. The very first film that used the Steadicam unit itself disassembles into a vest/arm breakdown. A spring-loaded arm totally articulating in the centre carries the weight of the camera placed on it. The tension in the spring can be adjusted to suit the camera weight. The arm is attached to the harness worn by the operator. In operating the Steadicam the idea is to hold the apparatus steady while moving. Originally designed to deal with a problem-shot in a film, the Steadicam is now in full production use all over the world, and is having a dramatic impact on television. The CBC's Papal coverage in September, for example, was largely made possible by Bob Crone and his Steadicam.

The following interview took place with Bob Crone in Toronto.

**Bob & Dave Crone...**

**The men from Steadicam**

by Ted Hackborn

Bob and Dave have over seven years of experience with the Steadicam, having both trained with Garrett Brown.

On a shoot, the Crones go out with the Steadicam unit and do the actual filming when the shot requires the system. The 55-75 lb Steadicam unit itself disassembles into a vest/arm breakdown. A spring-loaded arm totally articulating in the centre carries the weight of the camera placed on it. The tension in the spring can be adjusted to suit the camera weight. The arm is attached to the harness worn by the operator. In operating the Steadicam the idea is to hold the apparatus steady while moving. Originally designed to deal with a problem-shot in a film, the Steadicam is now in full production use all over the world, and is having a dramatic impact on television. The CBC's Papal coverage in September, for example, was largely made possible by Bob Crone and his Steadicam.

The following interview took place with Bob Crone in Toronto.

**Cinema Canada**: As a cameraman, what got you interested in Steadicam? What do you enjoy most about it and why?

**Bob Crone**: In the type of work I used to do, such as TV documentaries, I was limited to tripod or handheld camera. Travelling all over the world to such places as Vietnam, Laos, Cambodia, or Little Rock, Arkansas, the idea of hauling dolly tracks was impossible. My first thought on seeing Steadicam was: now, here's a tool that will allow me to move like never before!

The biggest sense of pleasure when using the Steadicam comes from doing a very convoluted move that cannot be achieved any other way, and doing it well. The reward is seeing the results in the screening room and watching every aspect of the shot, the framing, the motivation, the pace, all come together from beginning to end. It's a real 'high' to see an exceptionally well-executed shot done with Steadicam.

The best reason to use it, I would say, is because it looks at a scene more in the way a human being would. A human doesn't walk in a straight line like dolly tracks. There are options to shift weight from one foot to another as you see the scene. Steadicam puts the camera in the best possible position to view what's happening.

**Cinema Canada**: Was it a specific film or TV commercial you saw that first attracted you to the Steadicam?

**Bob Crone**: My first contact with the Steadicam was out at the Cinema Products factory in Los Angeles, California, over eight years ago: I was having modifications done to one of my other CP-16R cameras. While I was there, I met Garrett Brown, who invented the Steadicam, and Ed DiGiulio, the president of Cinema Products Corporation. They introduced me to the system in the development stages and asked me what I thought of it. I got quite entranced with the possibilities of this device in as much as it giving a whole new dimension to moving pictures. No longer would camera moves be encumbered with all that heavy steel, dolly, and crane.

Part of what you give up when you have tracks, dolly, and crane - in addition to the physical restrictions that the tracks...
the mixing theatre at Film House. We had a six-track stereo recording facility that enabled us to mix films, like the IMAX film North of Superior, in Canada. After I sold Film House I went back to work shooting film which is my real love. And it wasn’t long after that I saw the Steadicam and realized a lot more was involved than it appears.

Cinema Canada: You’ve won awards at a number of film festivals. Were they for your Steadicam work?

Bob Crone: No, not specifically. They were for other aspects of filmmaking. Although, those other aspects too are part of Steadicamming. The consummate Steadicam operator knows lighting, framing, movement, and the strength it takes to do repeated takes.

Cinema Canada: How was your son inspired to pick up the system?

Bob Crone: David had the opportunity to grow up in that period when we had Film House. He got the chance to play with all of the equipment. I wanted him to attend university and forget about film, but it’s a way to compose your picture on the move and have that freedom to be hung on, time after time, and no other tool will do that for you.

Cinema Canada: Could you give us a brief background of yourself? Your other interests in filmmaking?

Bob Crone: My filmmaking experience began when I came out of business college: I attended the Television Workshop of New York, graduating with what they call their Gold Camera Award, which was the highest award for achievement among the students that year. Then I worked in Virginia as an operations manager in a TV station before returning to Canada. It was here, in Canada, that I quickly discovered the most fascinating and enjoyable way to work was freelance. So in 1957 I formed my own little corporation and began shooting virtually anything, which could get my hands on, a lot of which was news, sports, and documentaries for the CBC.

I found that I developed a deep interest in doing the serious documentaries that were used on programs like This Hour Has 22 Days, which was a forerunner of the very popular 5 and 7, and the fifth estate, all of which I’ve worked for. There were a lot of needs that just couldn’t be filled in Canada. We didn’t have a professional sound mixing house that could roll sound-backs backwards and forwards in sync with the picture. There wasn’t a laboratory for 35mm Eastman colour negative. As an outsider, I had to grow my own needs, starting up Film House, and operated that from 1963 to 1973.

My Film House experience was marvelous: learning about organization, building a team and running a company. To give you a bit more, as a youngster, I took an odd-job morning copy job that had been invaluable to me. It doesn’t matter where I am, I don’t think I’ve been unable to shoot because I couldn’t come up with some kind of primitive repair. My knowledge of electronics went into the whole design concept of commercial companies like T.D.F. in Toronto and he did work as a production manager, sometimes as an assistant cameraman or operator and now and then as a Steadicam operator. I saw David’s interest in the Steadicam and kept encouraging him to put it on, work at it – practice, be critical. We would videotape all our practice shots – and review the tape over and over, critiquing and doing it again. Every time he strapped the Steadicam on, he would struggle to get a little better.

Cinema Canada: What has David recently worked on?

Bob Crone: David just finished a 16-week production in Vancouver entitled Clan of the Cave Bear for P.S.O. Productions. Before this film, he did an 11-week shoot, also out in Vancouver, called Runaway, starring Tom Selleck and some robots. David is just blessed with working on very big American productions, with directors and cameramen with good track records. For instance, the director on Clan of the Cave Bear, Michael Chapman, gained recognition in the film industry as a cinematographer. David was hired on both films as the camera operator and Steadicam operator. They wanted to have a Steadicam on the set, even though they knew they wouldn’t need to use it every day. Dave would leave the camera operating position to do a Steadicam shot and return when the special shot was done. He’s getting experience perhaps 10-15 years before anyone else, because he’s a very good Steadicam man.

Cinema Canada: Have you and your son worked together using the Steadicam? Is there a recent film?

Bob Crone: I suppose the one most recent film where we really worked as a team – shooting one and two cameras – sometimes shooting or David was Cinematographer for Mosaïques in the winter 1984 with Veronica Tennant and other ballet dancers from the National Ballet. We shot the film with free-flowing camera moves. Some 360° rotations around the dancers incorporated with ‘crane-like’ and ‘tracking like’ shots through the Steadicams.

I helped David when he was on the M.G.M. feature Mrs. Soffel shot here in January-February, 1984. I went out to every single little thing when we are out doing productions and the work is full of problems and when I am doing a shot – if I’ve chosen one of two little things he’ll think of what else I may need to go with it. Such as two C-Clamps, orcords or an extra cloth cord, for instance. We just go click!

Cinema Canada: Can you describe the Steadicam system you own and the modifications you’ve made?

Bob Crone: Well, there are a lot of things on our system that make it different. When I was out at the factory over eight years ago, I ordered on the very first Steadicam in its very rough form. At that stage, David and Ganymede Brown that I wanted the first one off the production line. They encouraged me not to take the first one away because they wanted to shake the bugs out of it.

So, instead I wound up getting Steadicam with serial number 3. We don’t actually have it anymore since it’s gone to the great camera repair room in the sky. We now own two Steadicam units: a Universal Steadicam II which has been through a lot of modification, and Steadicam III. There are now over 400 Steadicam all over the world.

We are continually modifying our equipment to suit our needs. For instance, the battery box mounted on the low-end of the camera-support arm, can be put on in a vertical or horizontal position and tracked left or right. That’s something our new Steadicam III has built-in. In our view this modification displaced the weight of the Steadicam and enabled us to do better shots. Another modification is that we have found a way to send a picture from a small video camera top-mounted adjacent to the camera operator. The picture is sent to a portable receiver-monitor without the encumbrance of cables. It gives us the freedom to move through a room of people and have our portable monitor and video-tape cassette recorder show the director exactly what the camera is seeing. Our video-tape assistant records the director of photography and anyone else involved with the shot to instantly play the shot back. This enables the director to ‘see’ where the camera position should be and where the talent should be as well. It ends the business of extra takes which so often turn out to be unnecessary. When you get a good take – and the director doesn’t feel comfortable unless he says he’s got one more just in case – it turns out that the ‘just in case’ shot becomes 8-10 extra takes, because the ‘next time’ the talent blows his/her lines or the ‘next time’ the camera runs out of film or the ‘next time’ the battery gives out. Until finally, you’ve gone for another 1 1/2 hr. to get the ‘just in case’ take, which wouldn’t be necessary at all if you could see what is being shot. The assistant confirms instantly that you have succeeded and allows you to move on. We have found time after time this has cut hours out of shooting time. It’s exciting to work on a project that you don’t generally see a three servo motor-system which mounts to and around the zoom lens, and which controls the zoom, and one controls the focus. That’s a real plus for the odd shot – when you really need to use all three. And the one helps me to be able to adjust the focal length of your lens, or pull it in when going from a dark area to a light area. This device is radio-controlled by a transmitting unit that the assistant person holds.
Cinema Canada: Do you video-tape anywhere you go?  
Bob Crone: Oh yes. Use the video tape so that you can then specifically discuss details of that picture with everybody rightfully concerned, as well as critique it yourself. Often, I see little things that I'm not doing but the director, or d.o.p. or producer hadn't even spotted them. I don't have to point that out, I'll just do a little better on the next take.

Cinema Canada: Do you rent your Steadicam equipment?  
Bob Crone: It isn't that we are unwilling, we just don't want to be in the rental business. But we wouldn't want to see anyone else rent equipment that we are well-acquainted with the tools. What we have discovered, much like Wm. F. White in Toronto discovered when they had Steadicam for rent, is that you don't want to deal with the weight thought that's all that it took to be a good Steadicam operator. So they would rent the thing, take it out, get a terrible result and then blame it on the Steadicam. After five years in the Steadicam rental business, Wm. F. White threw up their hands and said 'this is an artist's tool.'

Cinema Canada: How much pre-planning do you do before going to a location to shoot?  
Bob Crone: Often we'll go to a location well before we intend to shoot there, if it's possible. If it's a real situation and not a set, then there are a lot of things to be looked at that you might have anticipated: looking at floor plans is very good since they show length and width and obstacles; looking to see whether or not there are mirrors on the walls or whether there is glass which might show a reflection of the camera going by. You also have to look at where you can light the scene - because lighting for the Steadicam is different than lighting for a normal camera. On the film Canciones, we were tracking 180° and in some instances turning a full 360°. As you turn you don't want the light-stands in the shots. And sometimes we've had to resort to some very ingenious little tricks to make a shot seem like a continuous shot and it actually wasn't: it was two keeps.

Keeping your own shadow off the wall is partly a product of designing the shoot well: positioning yourself properly and if possible, lighting it so that things look natural.

Cinema Canada: What do you do to keep within the 'look' or shooting style of a picture?  
Bob Crone: Well, they'll often give me a copy of the original picture and tell me what they want and describe it as they imagine it. I'll look at what they're planning and, if I can, add to that something out of my experience. You see, we're often able to enhance the picture. I'll make that suggestion. Often means I'll do a dummy take for them, taping it so that they give the actors a rough idea of what it looks like. If they like that, it's a plus for us. Often they really know what they want. The easiest way to understand it is to take a little picture and show it to them. The next step is to actually show it - with some notes, and talk about it specifically, right on the spot. In a way, we have instant dailies.

Cinema Canada: What comments do you get after a shoot?  
Bob Crone: There are many. I did a picture last year in Toronto called Sueded for C.B.S., starring Greg Harrison. In one scene in the Kensington Market, Greg was taken over to me and complimented me on my Steadicam work. It was as if he almost forgot a camera was out there - because you just keep going so smoothly and unobtrusively. And after the dailies the director, Jerrold Freedman, said it was just so perfectly motivated. You come down with the camera off the meat market sign and start moving back. When the actors stop at the fruit-stand you stop with them and so on: right on. It couldn't have been better choreographed. And Freedman appreciated that sensitivity: it's not the kind of thing you can whisper in somebody's ear: 'Go now' or 'Stop now,' partly because it would distract the actors or be heard on the sound-track. Between the time the director would say start or stop and you do it, that split-second - which is the perfect moment - would have already passed. So you have to be able to make that judgement-call yourself and, when you do it, and do it right, the shot really rings just perfectly. Greg felt that the camera had not intruded on him one bit and it made it easier for him to act. Without the feeling of a camera being there, his performance, he felt, was enhanced.

So I've learned to scan the peripheral area of vision, to scan the actual action, and to scan the viewerfinder in sequence, and sense my position in relation to upcoming obstacles, door jams, stairways, etc. that make it possible for me to fly that camera through tight situations, otherwise you'd be bumping the workWood or other people around.

Cinema Canada: How does the Steadicam work? Some people say it has to go with gyros or mercury.  
Bob Crone: It's still a puzzle to some people. It's a mystery to them and it's very hard for them to believe that there are no gyros in there that stabilize the camera. It is simply a spring-tensioned arm performing the same way your human arm does. If it's steady and pointing in the right direction, that's the work the Steadicam is doing. Its design is very simple and the magic that is presented with smooth doll-like shots over the roughest of surfaces or in and out of the tightest spaces is the result of the operator's acquired skill. There are still a few people who don't know how to use the Steadicam or don't want to. It's a Cl ound - that was a bad experience with it before.

S P E C I A L R E P O R T

thought it was going to be. And after they've done that for a while then it's easy for them to welcome Steadicam onto the set and to allow maximum use to be made of it - not just use it for the shot that can't possibly be done with a zoom lens or tripod, crane, or dolly, but rather to use it for all it's worth. It's still going to take time for people to see good Steadicam work. The video-tape playback has helped quite a bit to gain confidence in directors and cameramen for our system.

Cinema Canada: What makes a good Steadicam operator?  
Bob Crone: A lot of stick-to-it-iveness, determination and a sensitivity to the composition and framing and a knack of handling people well. A willingness to criticise your own work constructively and to accept criticism from others and the time to learn to do it all well. I notice that the work I've done in the last year is better than the work I've done a year ago. We've recently been shooting a series for H.B.O. in Montreal called The Hitchhiker and the stuff I've shot, I feel, is the best I've ever done. So, I think to get good - really good - a person needs five years of determined effort. Owning your own Steadicam with all the various gadgets that are needed, really lets you get the kind of practice you need.

It's an acquired skill. Anybody could learn to do it, but they have to make up their mind that's what they want to do. They have to get into that Steadicam virtually everyday. And it isn't just getting to know the machine, but setting targets for yourself to move off one frame and on to another frame in a specific number of seconds without losing focus or balance, without being too fast, too slow or ill-motivated. You're making up a fluid photographic composition right as it's going.

I have been working with the Steadicam a good seven years now. When I brought Steadicam to Toronto, I had no intention of trying to offer my services with the Steadicam to commercial and feature-film production companies. I was thinking of it as a tool for my own use. I discovered that I didn't have enough hours to fully justify it and that it takes a lot more time and skill to get good at it. There's a bit of the athlete in being a good Steadicam operator.

I found that there were many people - many producers, who would use it for a few complicated shots. My business has changed in its focus and scope because of the Steadicam. It has changed me. More recently, we've added the word Skycam to our company name. It's the next frontier. Skycam is a system for suspending a camera in mid-air or hanging it in the air and it enables the operator to move a camera at speeds up to 27 mph in any complex combination of straight lines, curves, elevation and speeds. It's been used regularly on...
football games and I think it will change the way we look at any event in the future. With Skycam, you're not limited by the length of your tracks or height of your crane.

We've changed ourselves into moving picture specialists.

**Cinema Canada**: You did the Steadicam work for the Papal Tour across Canada for CBC in September. How did you prepare for the Pope's visit to Midland, Ontario?

**Bob Crone**: Well, since the Steadicam played a key roll in the walk that the Pope did through the Huronia Village in Midland, getting there a month before the event and walking the route was very important.

It was there that I met director John Thompson, and technical producer Ian Morrison. We discussed where to place the Pope in the best possible light in relation to the surrounding buildings and where to put ourselves in the best position to cover him to maximum advantage. This is an exercise that you go through both on paper by looking at the plans and the layout of the area and by walking it through and planning all the technical moves as well, such as where camera cables will be plugged in and unplugged.

Because we were on the air live and being fed by satellite to viewers all over the world it made me acutely aware of the fact that I had to be very careful to mentally go over every single step, forwards and backwards through every mechanical step of the shoot. When it came time to execute it physically, it seemed like a let-down. I had done the shot so often in my mind.

**Cinema Canada**: Did you enjoy doing the Papal Tour? **Bob Crone**: It was most satisfying to be on the air live and have no second chance. To know that my camera was sending out a signal to 500-700 million people world-wide. I knew that I was carrying the responsibility for the way all those people would see the Pope. And with only one take, you do it right the first time. Often I didn't know exactly where the Pope would go because frequently he did break away from the planned route to shake hands or touch children. He was very nimble on his feet.

**Cinema Canada**: Do you consider the Papal Tour a highlight to your career? **Bob Crone**: Certainly from a photographic standpoint. Maybe it's not the most satisfying piece of photography in as much as you couldn't control the lighting or framing or the Pope. It was a different kind of challenge and the challenge is one of really testing your resourcefulness right to the limit and beyond. You had to make up out of the moment the best possible composition that was available to you.

Because we had the Steadicam we got out of some jams. For instance, in Flatrock, Newfoundland. They had set up the platform for the Pope to speak facing the boats in the harbour. And they set up the scaffold and lighting and two cameras positioned out in front of him. As he got up to speak, he picked up the microphone and turned himself 180° right around so that his back was to the boats and to the two stationary cameras. So there wasn't a camera in front of the Pope. I quickly scurried around and ran off the little platform they built for me and worked my way around behind the people to come around in front of the Pope.

Then in Halifax, at St. Mary's Basilica, they had set up a camera across the street in front of the church. We were standing out in front of the church to pick the Pope up when he got out of his popemobile. Well, you probably saw that there was a parade of cars out in front of the popemobile, one was a bus full of press people. The bus turned the corner and stopped right in front of the only camera they had covering the church. That camera then could not see a thing and all I hear in my headphones is 'Steadicam you're our only hope.' If it hadn't been for the flexibility in those instances, of the Steadicam's fleet-footedness, to be able to reverse position and go for it, there would have been no shot at all.

---

**SCENE IN THE RIGHT PLACES**

From historic settings to colourful ethnic streets, Toronto can offer the right place for your scene. As well as terrific locations, we have:

- superb production companies
- top-notch film crews
- modern studios
- state-of-the-art post-production facilities
- excellent transportation services
- first-rate hotel accommodations
- fast permit and approval assistance

So, if you're planning to film in our city, why not give us a call. Together we'll make a scene — in the right places.

**10/Cinema Canada – December 1984**
Video Odyssey

by Ron Hallis

New York City, three o'clock in the afternoon, June 29, 1984. I enter an elevator on East 44th Street and ride calmly to my destination - Projection Systems International. The salesman's office is decorated with antique cameras and projectors. Ninety minute later, I emerge with the new tools - video recorder, camera, and 35 hours of tape.

The next two days I spend in a hotel room waiting out the rains that had flooded the roads to JFK airport. My departure for Africa delayed, I use this interval to test the new equipment.

In the hotel-room, I watch television, I make television. I tape my bath filling, the maid making the bed and vacuuming the floor. As I pan across the dingy walls I'm smiling: soon I would leave the developed world.

My dialogue with film was over, or at least "on hold." I had crossed to the video camp.

I was going to Zimbabwe to shoot a one-hour TV documentary for the American PBS network.

Unlike my first visit in 1980 which lasted twenty minutes when I was allowed to cross to the Zimbabwean side of the border from Mozambique to film several hundred refugees returning home, this time I would spend two months travel-
For most of the shooting of Transformation we based ourselves in the southwest of Zimbabwe, Matabeleland province, home of the minority Ndebele people and site of persistent attacks and banditry by so-called anti-government "dissidents." Gathering a minimum of significant information and differing views consumed several hours of tape - this would have been impossible on film, given the budget.

We were two weeks into the eight-week production and gliding at full momentum when I realized that we had shot as much tape as was originally budgeted for filmstock for the entire shoot.

I came to appreciate how video gave me the opportunity to record unexpected encounters and personalities during my travels through Matabeleland: a long conversation with an old peasant woman painting the walls of her hut who we found almost by chance as we drove to another destination. Material like this continued to build-up and played an important part in the continual moulding of the project.

Another aspect of the gathering power of video came to the fore during the taping of an interview with a woman who had direct contact with "dissidents." She was a 23-year-old nurse, daughter of a coal-miner and we were interviewing her three days after the infamous Lupote clinic attack. She, along with three of her colleagues, had been on duty when heavily-armed "dissidents" attacked and destroyed the clinic. She remained serene as she described her abduction and rape, began to cry quietly when she described how the "dissidents" forced her and her colleagues to set the clinic ablaze using material siphoned from a nearby diesel fuel tank.

I do not think that we could have reached the same degree of intimacy using film - certainly not with the quantity of film that would have been available for the scene. Video is a better listener. The informality, quietness and the 20-minute roll was far superior to 10 minutes of film, and were perfectly compatible with the tone of the situation.

The African approach to being filmed or photographed is rather formal. The process is more important than the end-result. The fact that somebody, somewhere, somehow will see the image is secondary. I have found myself often in the situation in which it would be insulting, or at least impolite and inappropriate, to turn the camera off, not turn it on, or not film something or somebody.

Video has a much wider aperture through which to receive and record this process, without forcing constrictions and time values that are foreign to the African sensibility.

To reach wonderful moments in a story, the whole must be told and experienced. Often stories of childhood precede stories of age and you find that the right concentration, lasting a few moments, requires a half-hour of warming up.

My last few days in Zimbabwe, waiting for an elusive interview with Prime Minister Robert Mugabe (I was bumped by Yasser Arafat and Julius Nyerere), were spent with Stella Chiweshe, a spirit-medium and professional Mbira (traditional finger piano) player.

During one of our meetings Stella asked me if I ever dreamed of my camera the way she often dreams of her Mbira, which always appears in her dreams as a person, never a musical instrument.

I told Stella I had never dreamed of my camera in that way. My fears and preoccupations were incomprehensible to her or perhaps I was unable to articulate them properly.

"Of what I tell you is for you, some for you and the camera, and some things about my Mbira I cannot tell you without angering the spirits. Then I do not know what they would do to me," she said.

But I was able to get across to her that my camera is an extension of mind, and eyes, prepared to stare long and hard at perplexing and simple things, searching for essence, for answers. As a filmmaker I was more concerned with building and building cheaply, given the expense of materials. As a videomaker, however, I am still concerned with building in a filmic sense, but with a fuller possession of the tools, and from materials that are cheap and abundant.

Video, I explained, was like matches from which comes the power to create fire.

I think she understood.

• Zimbabwean author Joyce Sikakane on location at Lake Kariba.
A film director's conversion

Editing on VHS

by Hrafn Gunnlaugsson

The Icelandic film When the Raven Flies, shown at the Berlin Festival last February, and at the recent Atlantic Film and Video Festival in Halifax, was edited on a VHS cassette. No work print was made; instead, all the negative film was played from a scanner straight onto VHS cassettes, to which a time-code was added. The material on the cassettes was then edited together on ordinary VHS machines, and the negative film cut to fit the cassettes according to the time-code. Naturally, this sounds a bit hard to believe, and a lot of questions were asked while this method was being used. In the following, the director Hrafn Gunnlaugsson briefly explains why this method was used, how the work progressed, what sort of problems arose, and what the outcome was from both a technical and financial point of view.

Why video instead of a cutting table?

I have often found myself sitting over a difficult scene on the cutting table, lengthening, shortening, changing, adding, until the work print had become scratched and sticky, jumping about on the screen every time we made a cut. When you have to deal with very precise action and you have finished splicing the clips together, it can be difficult to know whether the editing has really worked. It doesn’t make it any easier when some of the frames get lost or destroyed and you have to substitute from the leader.

My curiosity was aroused when Sven Skans, the head of the video department at AB-Film Teknik in Stockholm, informed me that they had got a system which could play the negative straight onto VHS cassettes with the time-code. They had edited some commercials with this method straight onto VHS, and it went quite well. That meant, that instead of making a workprint, the negative film could be put onto cassette and then selected and edited. He called it the EFC system. This method obviously led to the additional possibility of being able to edit many versions of the same scene, one after the other without ripping the first one apart, because the videomaster always remained unchanged however many copies were made of it. It was also possible to preview all the clips before they were processed and add or subtract one or more frames after each preview if you needed a very tight clip.

The editing systems that I considered using were the Panasonic 8500 video cassette recorder, and the editing controller NV-A500. When I had experimented with some other material. I decided to use this method for When the Raven Flies. In other words, no work print - just the negative put onto cassette and edited through the video.

The editing itself

To make sure it was safe, the laboratory ran all the negative through an analyser as soon as the developing was finished to check whether there were any scratches or lighting errors before it was played onto the cassette. No visible errors appeared, and I had all the material - some 17 hours - sent on 10 VHS cassettes to Iceland. The laboratory in Stockholm, but I did the editing here in Iceland. Unfortunately, Iceland is so small that it does not have a laboratory.

When I got hold of the cassettes, the soundman synchronized all the sound we had recorded onto them. That took him about three days. We used an ordinary Revox tape-recorder attached to a video machine, and put the sound onto the soundtrack of the video cassette. The idea from the beginning was to post-synchronize all the dialogue, so this was our guide-track. In this way, I was able to make sure that the pace of the dialogue was in keeping with the editing.

The new video machinery dispensed with the need for an editor to find and put together all the clips, so that I managed to do all the editing myself at home. I edited each scene separately on individual cassettes, and usually ended up with three to four versions of each scene. This method proved to be unproblematic, and in four weeks I had finished editing all the scenes and began to put them together. When that was over, I had a 150-minute film which was 40 minutes longer than the original estimate.

At this stage of the proceedings, the usefulness of this system became apparent. I was able to sit at home in front of a television screen, together with my assistants, and go over all the various prints of individual scenes, lengthening or shortening them without destroying what I had already made. This method was inspiring because it prompted one to experiment with daring and innovative changes, all of which could be made within a very short time. After a lot of careful viewing and many changes, the video-print was finally ready. The quality of the film on the cassette was beginning to decline a little since the final copy was four generations from the master. Actually, though that didn’t matter - the time-code was still legible.

Various technical problems

Up to then, everything had gone fine. The soundman used the cassettes that I had edited to post-synchronize the dialogue, and we went back to Stockholm, to finish off the work.

The next stage was to film a telecopy of the video cassette. The idea here was to use the telecopy to cut down the amount of time for the sound-tracking, if that should be necessary. When the sound work was over, the next plan was to cut the negative according to the telecopy. When I got hold of the telecopy, it turned out that the time code was doubled up in some of the shots, as if the film and the video were not synchronized. Naturally, we were really surprised because for the first time it looked as if the EFC system had gone wrong. After a thorough investigation as to how this failure had occurred, we found the answer. The video machine had occasionally edited at half-frame - that is to say, that a 50th of a second had been cut out so that some of the frames
were placed in the middle of the ones that preceded them. This of course meant that some shots were variously half-a-frame too long or too short. We decided to solve this problem by taking the negative, selecting one frame either to the right or the left so that each scene as a whole would be equally as long as its counterpart on the telecopy. The only risk was the possible variation of a single frame in two or three of the shots. By doing that, we hoped to retain the synchronization. This method worked, but entailed a good deal more trouble. If this had been foreseen, we could have avoided the problem by setting a frame-lock on the playing of the negative onto the telecopy for the negative editing, the cassette went so well that we only had to get the actors to repeat very few lines, and that only took one afternoon. The film was then mixed in Dolby stereo and completed like any other film.

Technical outcome
After going through this experience – editing a full-length feature film onto VHS – I can only say: why take the long way round? It is so much more convenient and more stimulating to be able to edit the same scenes in a multitude of variations than it is to sit in a dark editing room, with bits of film covering all the walls, and not be able to see new possibilities without destroying everything that you have already made.

Moreover, this working method allowed us to be able to send the composer of the screen-music copies of the scenes as soon as they had been edited. In this way, he was able to get his work underway before the final editing began. All the problems that came up could be easily avoided or completely solved.

The financial side
The costs of a work-print, editor, and a cutting table were dispensed with, and in their stead came the cost of scanning all the material, the hire of the video machinery (it is that cheap – about $4,500 – that it’s worthwhile buying it), the telecopy for the negative editing, the light-rush print copy for the mixing, and the lighting quality control.

If a third of the material is printed onto a work-print and 10 weeks taken on the cutting table, the costs of the old cutting-room method and the video-editing method are nearly the same. The new method has the advantage that all the material and not just selected scenes are played onto the video cassettes. That gives one a lot of freedom with the editing because so often one overlooks the whole and gets wrapped up in the fine details when having to decide which individual takes to print. When it is possible to see all the material together, these kinds of errors can be reduced to a minimum. It also means that the scene and clapperboard markings become unnecessary when using post-synchronization because all the material is in the cassette. We didn’t use a script-girl to mark the scenes and trusted our own memories for the sound-track guide, where we read in all the information. That presented no problems – thus it was possible to save all the film that would have been used up by the markings, as well as the salary for the script-girl.

If I do another full-length feature, I have no doubts about the method – video. It has everything in its favour, and if you don’t believe me, go and see When the Raven Flies.
Rock video: The return to film's first principles

by Sam Zero

The rock video has been getting a great deal of press and air time recently. In the October issue of Cinema Canada, John Harkness has even attempted, however prematurely, to define a morphology for this new genre which necessarily borrows from every previous medium while finding its own particular characteristics. Genre, then, is the essential factor Harkness fails to discover: the characteristic entity of rock video's attempts to discover genres within the formal whole. This intrinsic value of the RV is inherent both in rock 'n' roll and in the first principles of the two-dimensional moving image. Harkness shows in his historical reference to D.W. Griffith, but not in its placement in time nor in geography, that rock video's major contributions to the RV have been the experiments of Lev Kuleshov in revolutionary Russian filmmaking and the works of Andy Warhol. A genre is something that carries its own nature and mass; in short, it has a style or personality all its own within a formalistic and contextual framework.

Harkness achieves the instigation of various rock video forms within the whole RV framework, failing to realize that there is a common thread in all the videos that is both filmic and characteristic of a burgeoning form. Whether an evaluation as art could be raised at this stage is another question. The thing that is important here is that there is nothing intrinsically 'video' about RVs, yet. They are still entrenched in the cinematic - that is, they find their fuel for expression, or expressionlessness, in aspects of creation that are not particularly to video but to film. Thus it is too soon to translate the RV genre into a theory of its form and structure before determining whether that structure is capable of being studied through and finding that characteristic which makes the language of that structure particular to it: is there a video morphology? As Harkness points out, most RVs do not even attempt to find one. However, it is possible to discover an intrinsic, though cinematic, characteristic that is particular to rock video and has its roots firmly planted in visual history. In so doing it may become possible for the video creators to attack the medium's form and find in it an expressive factor that video as a medium can bring forth: I feel, however, that they will be hard pressed to find one. The video line, unlike the film frame is not perceptible as a coherent image to an audience, and even if it were there would be the movie's still frame to which it would echo. But sound on video is even more like the radio or the amplified speaker than film sound. The colour and compositional aspects of both media will always parallel painting. But RVs have managed to rescue from all of this the one aspect of visual style that makes film (it use film for obvious reasons) different from any of its feeder forms.

It has been said that film started as an attempt to increase the reality and immediatness of an image. Film, here, that transitory object layered with illusion that captures an event in still, deathlike, exactitude. The photograph, of course, is not a new path for formalistic painting and experimentation in the 'finer arts' because a portrait or landscape could be 'taken' as seen and often hand-tinted later. At these early stages of motion pictures, color, and toys of various descriptions were invented to create the illusion of motion, and the celluloid strip arrived and the still, black and white, image came to life - it moved. There is nothing more central to film than that this one simple, at the time devastating fact of a moving image. It is a means of creating or destroying an effective communication. For years both have infiltrated the cultural strata and now that video is becoming a central force in communications, the rock industry is using it to sell. But because each is a synthetic sounds, and these elements are the showcase items along with the immediate surroundings and changing with the times. Video is the natural medium for the visual expression of rock. Since rock, video first hit the music scene it has always affected or reflected popular social trends, and quite often caused some. Rock has, like television, seldom set out to be too political or philosophical. It is only recently with the ever-increasing popularity of the anti-nuclear and the welcome realization of the political force behind women's issues, that rock has begun to take these things into its repertoire, expanding beyond the simple, minds, baby-baby-hostility, brutality, and jilted idiot songs, which unfortunately will always exist unless some wonderful transformation take place. Similar television takes these new popular subjects at a time when the two media, rock and video, have realized their natural affinity. Perhaps one day they will help us to understand that these topics do not go the way of obscurity like so many fads of fashion; it cannot help but raise the social awareness of a great majority of the public by the osmosis of message into media that must occur to achieve a recognition of the truth. Thus, the social reality will take another "new wave" step forward, be it through revolutions of individual psych or communal relationships.

In this affinity between rock and video lies the all-encompassing entity that is the morpheme of video and video technology: the single factor that can create or destroy an effective communication. For years both have infiltrated the cultural strata and now that video is becoming a central force in communications, the rock industry is using it to sell. But because each is a universalizing social phenomena, the sudden world-wide accessibility to both, through the satellite dish, has brought them under the critical eye: which tests the value of that which has the potential to be meaningful. Video and rock have always had that potential by their ever-present influence on the modern society. It is in this social sphere that video finds its personality: its own particular strength. The transient vacuums of identity and the video and rock assure them creative immortality. They achieve this quality in their situation as culturally affected and effective entities. It has come time to take a closer practical look at each of them within that framework. In doing so it will demand of them a culturally-responsible creativity.

* It is important to understand that there is not a 'model' that one can go by since there is no one to follow. A group, its members, its audience, are all a new entity.
